

RackSavant and Archilogic: Spatial Intelligence for Retail Operations

How RackSavant and Archilogic combine floor plan data with real-time spatial insights to create opportunities for retailers to optimize operations, reduce costs, and increase revenue.

THE CASE STUDY: A SPATIAL DATA PIPELINE FOR PHYSICAL RETAIL

Retail spaces generate valuable data every day. RackSavant and Archilogic work together to connect floor plan intelligence with real-time spatial insights, helping retailers transform static spaces into dynamic, data-driven environments that optimize for both customer experience and operational efficiency.

01

Create the spatial foundation

Archilogic transforms floor plans into structured spatial models with defined zones, creating a foundation for location-aware analytics that RackSavant uses to deliver real-time insights.

Spatial intelligence platform showing zone-level analytics anchored to floor plan locations

02

Connect data to space

RackSavant anchors real-time data streams to specific locations within the Archilogic floor plan, converting raw information into spatially meaningful insights.

Real-time analytics dashboard displaying temporal patterns and zone-level metrics

03

Layer multiple data sources

RackSavant integrates different data streams within Archilogic's spatial framework, creating richer insights and validation opportunities.

04

Generate actionable insights

RackSavant and Archilogic translate spatial patterns into operational recommendations, enabling data-driven decisions that optimize both costs and customer experience.

"Having spatial context for our operational data changed everything. We went from making decisions based on assumptions to making them based on what's actually happening in our space."

Tiffany, Owner, Savvy Consignment SF

Why this matters to Archilogic

- **Spatial system of record**

Archilogic provides the spatial foundation that gives every RackSavant data point a location and context within the physical environment.

- **Sensor-agnostic foundation**

RackSavant's multiple data sources reference the same Archilogic spatial framework, creating a unified view of what's happening across the retail environment.

- **Actionable retail analytics**

Archilogic's consistent spatial model enables RackSavant's zone-level analytics that drive operational improvements across staffing, merchandising, and customer experience.

WHAT THIS PILOT PROVES NOW

The pipeline runs end to end in a live store. Archilogic's floor plan data gives the store a structured spatial model with defined zones, and RackSavant's in-store wireless sensors stream readings into that model.

Each sensor reading now resolves to a zone on the Archilogic floor plan through a 1:1 sensor-to-space ID mapping. That is what the pilot shows today. Measurement comes next: computer-vision validation and operational KPIs will be tracked against this spatial record in the following phase.

"Sensor data is only useful when it knows where it is. Archilogic gives every reading a place on a structured floor plan, so RackSavant can turn a signal into a zone and a zone into a decision. The pilot shows that the same spatial record that runs office portfolios works in a retail store."

Sjef Tijssen, COO, Archilogic

IMMEDIATE BENEFITS: REAL-TIME FOOT TRAFFIC INTELLIGENCE

The moment foot traffic detection goes live, retailers gain immediate visibility into customer behavior patterns. This real-time intelligence enables instant operational improvements and data-driven decision making from day one.

- **Instant visibility** into peak traffic times and customer flow patterns across zones
- **Immediate staffing optimization** by matching coverage to actual demand, not assumptions
- **Real-time alerts** for unexpected traffic surges or understaffed high-value periods
- **Scalable across locations** to identify universal patterns and location-specific opportunities

Ready to transform your retail space with RackSavant and Archilogic?
